4. Black Top Tube (NMR)	8. Lavender Top (EDTA)	12. Royal Blue (Trace Metal W/O EDTA)	

### Phlebotomy Tips:

- **888** is the code for Phlebotomy services provided by Accurate Diagnostic Labs (Not for use by physician office, or Urine, Swab or Stool Specimens).
- Do not leave the tourniquet on for more than 1 minute. Release it as soon as blood flow is established.
- Do not ask the patient to clench their fist excessively during phlebotomy. Avoid the use of small gauge needles.
- Follow the recommended order of tubes when drawing multiple types of tubes (see Order of Collection above).
- Prepare labels for the tubes to be drawn with the complete first and last name and date of birth of the patient. Be sure to affix the labels immediately after drawing.
- Do not vigorously shake the tube. Gently mix the additive by inverting the tube 6-7 times.
- Leave the SST tubes in an upright position for at least 20 minutes after collection to allow proper clot formation. Do not leave the tube un-spun for over 60 minutes.
- Centrifuge for 15 minutes. Do not put the specimen ready to be shipped to the laboratory through any kind of vigorous motion.

### Proper Method of Freezing Specimen:

- **Serum Separator Tube:** After the blood in SST tube is clotted, spin the tube for 15 minutes. Transfer the serum using transfer pipette in labeled (complete patient name, date of birth and resulting transferred specimen type) transport tube. Cap the tube tightly and freeze it in the freezer or on dry ice. Place the frozen specimen in a bag along with the requisition, label the bag with a “frozen” sticker, and provide it to the Courier, keeping it separate from regular specimens.
- **Plain Red Top Tube:** Serum of Plain Red is known as Serum PR. After the blood in Plain Red tube is clotted, spin the tube for 10 minutes. Transfer the plasma using transfer pipette ( make sure blood isn’t transferred with serum) in labeled (complete patient name, date of birth and resulting transferred specimen type) transport tube. Cap the tube tightly and freeze it in the freezer or on dry ice. Place the frozen specimen in a bag along with the requisition, label the bag with “frozen” sticker, and provide it to the courier, keeping it separate from regular specimens.
- **Lavender Top Tube:** Plasma of Lavender Top Tube is known as EDTA Plasma. After gently inverting tube for 6-7 times, spin the tube for 10 minutes. Transfer the plasma using transfer pipette (make sure blood isn’t transferred with plasma) in labeled (complete patient name, date of birth and resulting transferred specimen type) transport tube. Cap the tube tightly and freeze it in freezer or on dry ice. Place the frozen specimen in a bag along with the requisition, label the bag and provide it to the courier, keeping it separate from regular specimens.
- **Blue Top Tube:** Plasma of Blue Top Tube is known as Citrated Plasma. After gently inverting tube for 6-7 times, spin the tube for 10 minutes. Transfer the plasma using transfer pipette (make sure blood isn’t transferred with plasma) in labeled (complete patient name, date of birth and resulting transferred specimen type) transport tube. Cap the tube tightly and freeze it in the freezer or on dry ice. Place the frozen specimen in a bag along with the requisition, label the bag with a “frozen” sticker, and provide it to the courier, keeping it separate from regular specimens.
- **Serotonin Kit:** After gently inverting tube 6-7 times, transfer whole blood to transport tube containing 75 mg ascorbic acid. Label the tube (complete patient name, date of birth and test name). Screw-cap the tube and thoroughly mix by inverting whole blood/ascorbic acid mixture another 10 times. Freeze transport tube in freezer or on dry ice. Send the whole collection to Laboratory. Place the frozen specimen in a bag along with the requisition, label the bag with a “frozen” sticker, and provide it to the courier, keeping it separate from regular specimens.
- **Plasma Preparation Tube:** Plasma of Plasma Preparation Tube is known as PPT Plasma. After centrifuging, transfer the plasma to transport tube. Transfer the plasma using transfer pipette (make sure blood isn’t transferred with plasma) in labeled (complete patient name, date of birth and resulting transferred specimen type) transport tube. Cap the tube tightly and freeze it in the freezer or on dry ice. Place the frozen specimen in a bag along with the requisition, label the bag with a “frozen” sticker, and provide it to the courier, keeping it separate from regular specimens.
